SUMMARY

B.Tech CSE graduate (June 2026) specializing in robust backend architectures (**Java/Spring Boot, Node.js**) and real-time WebSocket systems. Adept at full-stack development with a unique edge in hardware-web integration via Raspberry Pi. Hands-on experience writing **C++** for Raspberry Pi to serve offline pages and build telemetry backends using **Crow and Boost.Asio**. Seeking a backend or full-stack developer role to engineer scalable, end-to-end software solutions.

EDUCATION

Bachelor of Technology in Computer Science and Engineering

Nov 2022 – Jun 2026

[University of Kalyani](#)

Kalyani, India

- **Leadership:** Academic General Secretary (AGS), Department of CSE (2024)
- **Affiliations:** Former Member, IEEE Computational Intelligence Society (CIS)

SKILLS

Languages: Java 17, JavaScript/TypeScript, C/C++, Python

Backend & Frameworks: Node.js, Spring Boot, Express.js, REST APIs, Microservices

Frontend: React.js, MUI (Material UI), Bootstrap

Systems & Embedded: Raspberry Pi, Raspberry Pi Pico, ADIY Evaluation Board, GSM EC200, MQTT, WebSockets, Real-Time Data Pipelines

Infrastructure & Tools: Nginx, PM2, Docker, MySQL, SQLite, Maven, Git

Concepts: Theoretical AI (Genetic Algorithms), Cryptography (RSA Signatures), RBAC, JWT

EXPERIENCE

Full Stack & Systems Engineer

12/2025 – Present

[Lilac Inc](#)

Kolkata, India

- **LC Gate Monitoring System (Java & Embedded):** Built a Java backend to handle real-time LC gate telemetry, utilizing **Raspberry Pi Pico** microcontrollers as slave nodes reporting to a **Raspberry Pi 4** master device. Leveraged **MQTT and WebSockets** for instant data syncing to central web dashboards.
- **AudioLogPro Server (Node.js):** Engineered and deployed a real-time audio communication server using **Node.js and WebSockets**, enabling live streaming and concurrent session management. Configured **Nginx** as a reverse proxy and utilized **PM2** for robust process management, load balancing, and high availability.
- **Systems Telemetry (C++):** Built high-performance backend services using **C++ (Crow + Boost.Asio)** to expose hardware metrics (CPU, disk, network) via REST APIs for real-time frontend monitoring.

PROJECTS

[dev.restaurant Ecosystem](#) | *Spring Boot, React, MySQL, Node.js*

[Live / GitHub](#)

- Engineered a **microservice-based full-stack ecosystem** consisting of a Spring Boot REST API, a React admin dashboard, and dual Android clients, all synchronized over a shared real-time order state layer.
- Secured the platform implementing **Spring MVC, JWT, and Role-Based Access Control (RBAC)**, managing distributed order states with instant propagation across services.

[ZeroProof: Anonymous Feedback System](#) | *Node.js, TypeScript, React*

[Live / GitHub](#)

- Designed a **full-stack secure feedback platform** with a Node.js backend, handling OTP invite flows, voting ticket issuance, and admin dashboards end-to-end.
- Implemented **RSA Blind Signatures** to guarantee cryptographic respondent anonymity, leveraging clean REST API architecture and JWT session management.

[Employee Management System](#) | *Spring Boot, React, Bootstrap, Maven*

[GitHub](#)

- Full-stack corporate attendance tracking app with **role-based access control**, real-time employee onboarding, and secure admin/employee portal separation.
- Built a responsive read-only employee portal using **React and Axios** for seamless REST API communication.
